

# Physics Opportunities at a Muon Collider

Kirk T. McDonald

*Joseph Henry Laboratories, Princeton University, Princeton, NJ 08544*

The case for a future high-energy collider based on muon beams is briefly reviewed.

## 1 I Want to Believe...

- That elementary particle physics will prosper for a 2nd century with laboratory experiments based on innovative particle sources.
- That a full range of new phenomena will be investigated:
  - mass  $\Rightarrow$  a 2nd  $3 \times 3$  (or larger?) mixing matrix.
  - Precision studies of Higgs bosons.
  - A rich supersymmetric sector.
  - ... And more ...
- That our investment in future accelerators will result in more cost-effective technology, capable of extension to 10's of TeV of constituent CoM energy.
- That a **Muon Collider** [1, 2] based on ionization cooling is the best option to accomplish the above.

## 2 Ionization Cooling (An Idea So Simple It Might Just Work)

- Ionization: takes momentum away.
- RF acceleration: puts momentum back along  $z$  axis.
- $\Rightarrow$  Transverse “cooling”.  
Particles are slowed along their path ( $dE/dx$ )

Particles are accelerated longitudinally Origin: G.K. O'Neill (1956) [3]

- This won't work for electrons or protons.
- So use muons: Balbekov [4], Budker [5], Skrinsky [6], late 1960's.

### 3 The Details are Delicate

Use channel of LH<sub>2</sub> absorbers, rf cavities and alternating solenoids (to avoid buildup of angular momentum).

One cell of the cooling channel:

But, the energy spread rises due to “straggling”.

⇒ Must exchange longitudinal and transverse emittance frequently to avoid beam loss due to bunch spreading.

Can reduce energy spread by a wedge absorber at a momentum dispersion point:

[6-D emittance constant (at best) in this process.]

### 4 What is a Muon Collider?

An accelerator complex in which

- Muons (both  $\mu^+$  and  $\mu^-$ ) are collected from pion decay following a  $pN$  interaction.
- Muon phase volume is reduced by  $10^6$  by ionization cooling.

- The cooled muons are accelerated and then stored in a ring.
- $\mu^+\mu^-$  collisions are observed over the useful muon life of  $\approx 1000$  turns at any energy.
- Intense neutrino beams and spallation neutron beams are available as byproducts.

Muons decay:  $\mu \rightarrow e\nu \quad \Rightarrow$

- Must cool muons quickly (stochastic cooling won't do).
- Detector backgrounds at LHC level.
- Potential personnel hazard from  $\nu$  interactions.

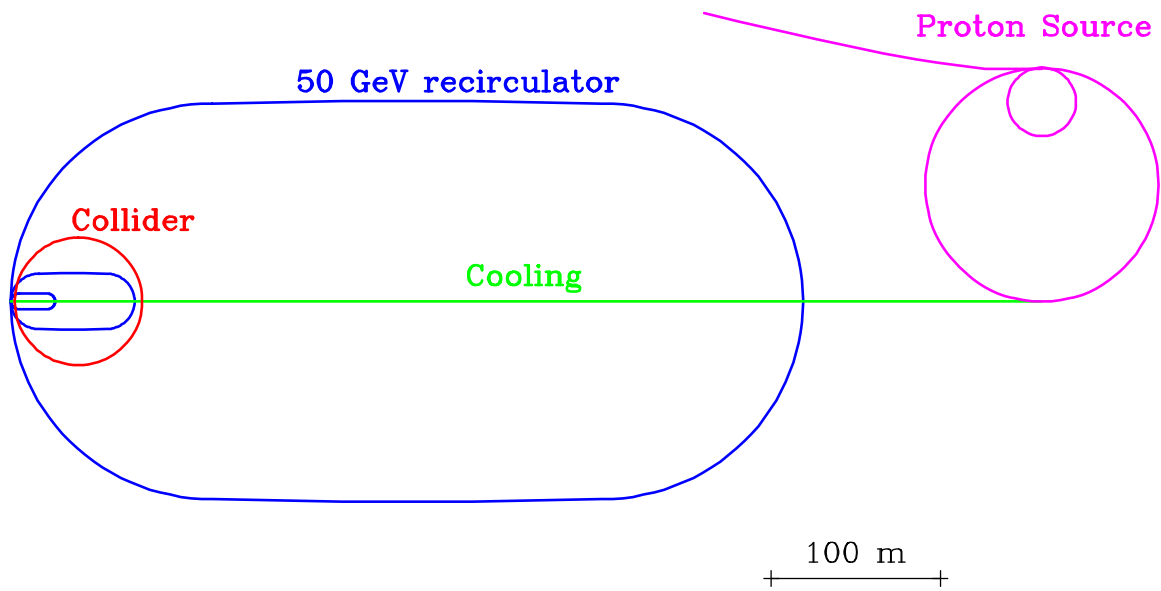

Table 1: Baseline parameters for high- and low-energy muon colliders. Higgs/year assumes a cross section  $\sigma = 5 \times 10^4$  fb; a Higgs width  $\Gamma = 2.7$  MeV; 1 year =  $10^7$  s.

CoM energy	TeV	3	0.4			
$p$ energy	GeV	16	16			
$p$ 's/bunch		$2.5 \times 10^{13}$	$2.5 \times 10^{13}$	$5 \times 10^{13}$		
Bunches/fill		4	4	2		
Rep. rate	Hz	15	15	15		
$p$ power	MW	4	4	4		
$\mu$ /bunch		$2 \times 10^{12}$	$2 \times 10^{12}$	$4 \times 10^{12}$		
$\mu$ power	MW	28	4	1		
Wall power	MW	204	120	81		
Collider circum.	m	6000	1000	350		
Ave bending field	T	5.2	4.7	3		
Depth	m	500	100	10		
Rms $\Delta P/P$	%	0.16	0.14	0.12	0.01	0.003
$6\sigma$ $\epsilon_6$	$(\pi\text{m})^3$	$1.7 \times 10^{-10}$	$1.7 \times 10^{-10}$	$1.7 \times 10^{-10}$	$1.7 \times 10^{-10}$	$1.7 \times 10^{-10}$
Rms $\epsilon_n$	$\pi$ mm-mrad	50	50	85	195	290
$\beta^*$	cm	0.3	2.6	4.1	9.4	14.1
$\sigma_z$	cm	0.3	2.6	4.1	9.4	14.1
$\sigma_r$ spot	$\mu\text{m}$	3.2	26	86	196	294
$\sigma_\theta$ IP	mrad	1.1	1.0	2.1	2.1	2.1
Tune shift		0.044	0.044	0.051	0.022	0.015
$n_{\text{turns}}$ (effective)		785	700	450	450	450
Luminosity	$\text{cm}^{-2}\text{s}^{-1}$	$7 \times 10^{34}$	$10^{33}$	$1.2 \times 10^{32}$	$2.2 \times 10^{31}$	$10^{31}$
Higgs/year				$1.9 \times 10^3$	$4 \times 10^3$	$3.9 \times 10^3$

Comparison of footprints of various future colliders:

A First Muon Collider to study light-Higgs production:

## 5 The Case for a Muon Collider

- More affordable than an  $e^+e^-$  collider at the TeV (LHC) scale.
- More affordable than either a hadron or an  $e^+e^-$  collider for (effective) energies beyond the LHC.
- Precision initial state superior even to  $e^+e^-$ .  
 Muon polarization  $\approx 25\%$ ,  $\Rightarrow$  can determine  $E_{beam}$  to  $10^{-5}$  via  $g - 2$  spin precession [7].

$t\bar{t}$  threshold:

Nearly degenerate  $A^0$  and  $H^0$ :

- Initial machine could produce light Higgs via  $s$ -channel [8]:  
 Higgs coupling to  $\mu$  is  $(m_\mu/m_e)^2 \approx 40,000\times$  that to  $e$ .  
 Beam energy resolution at a muon collider  $< 10^{-5}$ ,  
 $\Rightarrow$  Measure Higgs width.  
 Add rings to 3 TeV later.
- Neutrino beams from  $\mu$  decay about  $10^4$  hotter than present.  
 Possible initial scenario in a low-energy muon storage ring [9].

Study  $CP$  violation via  $CP$  conjugate initial states: 
$$\left\{ \begin{array}{l} \mu^+ \rightarrow e^+ \bar{\nu}_\mu \nu_e \\ \mu^- \rightarrow e^- \nu_\mu \bar{\nu}_e \end{array} \right.$$

## 6 Future Frontier Facilities

(A Personal Assessment)

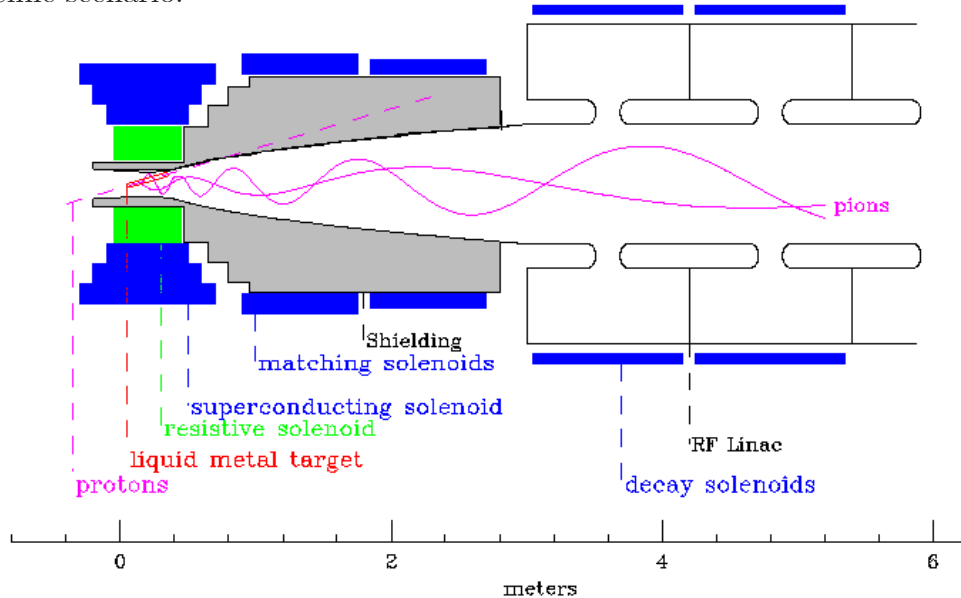

- Hadron collider (LHC, SSC):  $\approx \$100\text{k/m}$  [magnets].  
 $\approx 2 \text{ km}$  per TeV of CM energy.  
 Ex: LHC has 14-TeV CM energy, 27 km ring,  $\approx \$3\text{B}$ .

- Linear  $e^+e^-$  collider (SLAC, NLC(?)):  $\approx$  \$200k/m [rf].  
 $\approx$  20 km per TeV of CM energy;  
 But a lepton collider needs only  $\approx$  1/10 the CM energy to have equivalent physics reach to a hadron collider.  
 Ex: NLC, 1.5-TeV CM energy, 30 km long,  $\approx$  \$6B (?).
- Muon collider:  $\approx$  \$1B for source/cooler + \$100k/m for rings  
 Well-defined leptonic initial state.  
 $m_\mu/m_e \approx 200 \Rightarrow$  Little beam radiation.  
 $\Rightarrow$  Can use storage rings.  
 $\Rightarrow$  Smaller footprint.  
 Technology: closer to hadron colliders.  
 $\approx$  6 km of ring per TeV of CM energy.  
 Ex: 3-TeV muon collider,  $\approx$  \$3B (?), would have physics reach well beyond the LHC.

## 7 Muon Collider R&D Program

- Targetry and Capture at a Muon Collider Source [10, 11].

Baseline scenario:

To achieve useful physics luminosity, a muon collider must produce about  $10^{14}$   $\mu$ /sec.

- $\Rightarrow > 10^{15}$  proton/sec onto a high- $Z$  target  $\Leftrightarrow$  4 MW beam power.
- Capture pions of  $P_\perp \lesssim 200$  MeV/ $c$  in a 20-T solenoid magnet.
- Transfer the pions into a 1.25-T-solenoid decay channel.
- Compress  $\pi/\mu$  bunch energy with rf cavities and deliver to muon cooling channel.

Proposed R&D facility:

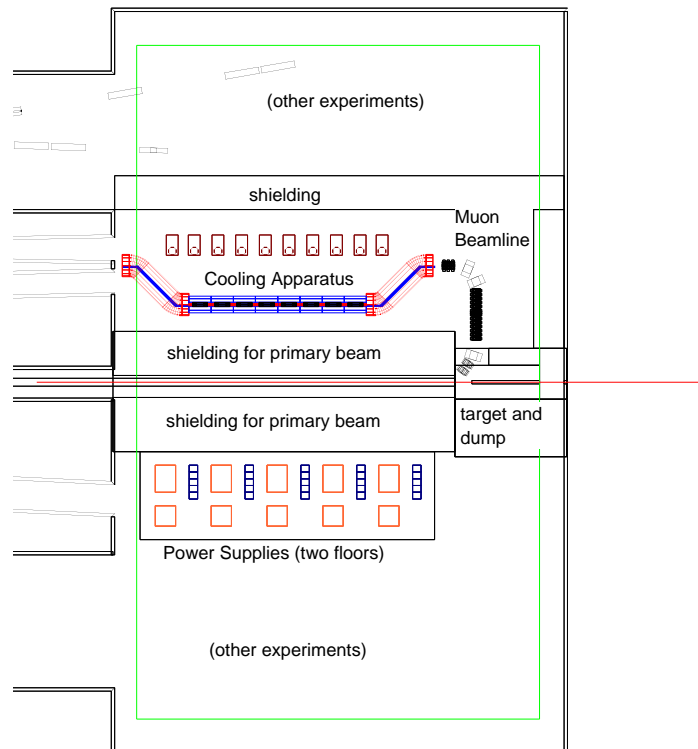

- Ionization Cooling for a High Luminosity Muon Collider [12, 13].

Test basic cooling components:

- Alternating solenoid lattice, RF cavities,  $\text{LH}_2$  absorber.
- Lithium lens (for final cooling).
- Dispersion + wedge absorbers to exchange longitudinal and transverse phase space.

Track individual muons; simulate a bunch in software.

Possible site: Meson Lab at Fermilab:

Cooling channel components:

## 8 Upcoming Workshops

(See [http://www.cap.bnl.gov/mumu/table\\_workshop.html](http://www.cap.bnl.gov/mumu/table_workshop.html))

- Muon Collider Collaboration Meeting, May 20-26, 1999, St. Croix.
- Neutrino Factories Based on Muon Accumulators, July 5-9, 1999, Lyon/CERN.
- Muon Colliders at the Highest Energies, Sept. 27-Oct. 1, 1999, Montauk, NY.
- Physics Potential and Development of  $\mu^+\mu^-$  Colliders, Dec. 14-19, 1999, San Francisco.
