# MUON COLLIDER TARGET STATION

- PROTON BEAM IMPINGE ON LIQUID TARGET/JET.
- INTERACTION PARAMETERS ARE OPTIMIZED FOR MAXIMUM MESON YIELD.
- MAGNETIC FIELD OF  $\sim 20$  T ALONG STATION AXIS, NEAR TARGET REGION, SIPHONS CHARGED PARTICLES DOWNSTREAM WHERE  $B \sim 1.5$  T.
- NbSn SUPERCONDUCTING COILS ( $\sim 15$  T) AND Cu COILS ( $\sim 5$  T) WILL CREATE THE MAGNETIC FIELD AROUND INTERACTION AREA.  
NbTi SUPERCONDUCTING (SC) COILS FOR DOWNSTREAM MAGNETIC FIELD.
- MOST OF BEAM ENERGY WILL END UP IN TARGET STATION. SHIELDING MATERIAL TO PROTECT SC COILS.
- SHIELDING VESSELS TO CONTAIN SHIELDING MATERIAL.
- SC SOLENOIDS CRYOGENIC COOLING COMPONENTS.
- LIQUID TARGET COLLECTING TANK (+ BEAM DUMP) AND REMOVAL CONFIGURATION.

## SHIELDING MATERIAL OPTIMIZATION (TYPE/QUANTITY)

- MINIMIZE DEMAND ON SC CRYOGENIC OPERATIONS.
- AVOID QUENCHING.
- RADIATION DAMAGE WITHIN "ACCEPTABLE" LIMITS.
- SATISFY ENGINEERING REQUIREMENTS FROM STRUCTURAL/MECHANICAL LIMITS

Aspect Ratio: Y:Z = 1:3.25

**Hg vs. Ga TARGET: IT APPEARS PROTONS INTERACT WITH Ga JET IN A LONGER REGION THAN IN THE Hg TO COMPANSATE FOR THE SMALLER SIZE Ga ATOMS.**

**IS IT POSSIBLE TO ROTATE Ga JET TO ALLOW PROTONS ENTER SOONER THE POOL AND THEREFORE TRAVEL LONGER DISTANCE IN Ga POOL?**

Ga TARGET RECIEVES ABOUT HALF THE POWER DEPOSITED IN Hg, WHILE Ga POOL ABOUT 13 kW LESS ENERGY THAN THAT IN Hg POOL.

SINCE Ga ATOMS HAVE MUCH SMALLER ATOMIC NUMBER (31) THAN Hg ATOMS (80) A SMALLER NUMBER OF INTERACTIONS WILL OCCUR BETWEEN p AND Ga TARGET. A SMALLER NUMBER OF INTERACTIONS WILL ALSO TAKE PLACE BETWEEN PROTONS AND Ga ATOMS IN THE POOL. IN ADDITION SINCE Ga IS A "SOFTER" TARGET THE SCATTERING ANGLES ARE SMALLER. MORE PROTONS IS EXPECTED TO END UP IN THE Ga POOL.

THAT WILL SOMEHOW MITIGATE THE EFFECT OF THE INTERACTION LENGTH p-Ga "DISSADVANTAGE" AND AT THE END WE GET ABOUT THE SAME DP IN Hg AND Ga POOLS(ASSUMING MOST OF THE DP IN THE POOL IS DUE TO PROTONS AND/OR THE DP FROM OTHER RADIATION SOURCES IS ABOUT THE SAME FOR BOTH CASES.

Be WINDOW ABOUT SAME DP FOR BOTH TARGETS.

SH#1 APPEARS TO HAVE A SPOT WITH DPD>0.15 mW/g. STATISTICAL FLUCTUATIONS CAN BE SIGNIFICANT FOR A VOLUME AT IR=120 cm WHERE VERY LITTLE ENERGY IS DEPOSITED AND THERE IS MORE UNIFORMITY IN THE AZIMUTHAL DPD DISTRIBUTION. SIMULATIONS WITH LARGER NUMBER OF EVENTS/LARGER VOLUMES MAYBE NECESSARY. WORK IN PROGRESS.
